1 FUNZIONI E RISORSE MODBUS

Modbus is a client/server communication protocol between devices connected on a *network*.

Modbus instruments communicate using a master/slave technique in which only one device (master) can send messages. The other devices on the *network* (slave) respond by returning the data requested by the master or performing the action indicated in the message sent. A slave is a device connected to the *network* that processes information and sends the results to the master using the Modbus protocol.

The master can send messages to individual slaves, or send messages to the whole *network* (broadcast), whereas the slave instruments respond to the messages only individually and to the master device.

The Modbus standard used by Eliwell provides for the use of RTU coding for data transmission.

1.1 Data format (RTU)

The coding model used defines the structure of messages transmitted on the *network* and the way in which this information is decoded. The type of coding is normally selected according to specific parameters (baud rate, parity, etc.), also, certain devices only support certain coding models, however it must be the same for all the instruments connected to a Modbus *network*.

The protocol uses the binary RTU method with the byte made up as follows:
8 bits for data, even parity bit (not configurable), 1 stop bit.

NOTE: the transmission speed must be set to 9600 baud.

Setting the parameters allows the *instrument* to be fully configurable

They can be modified by means of:

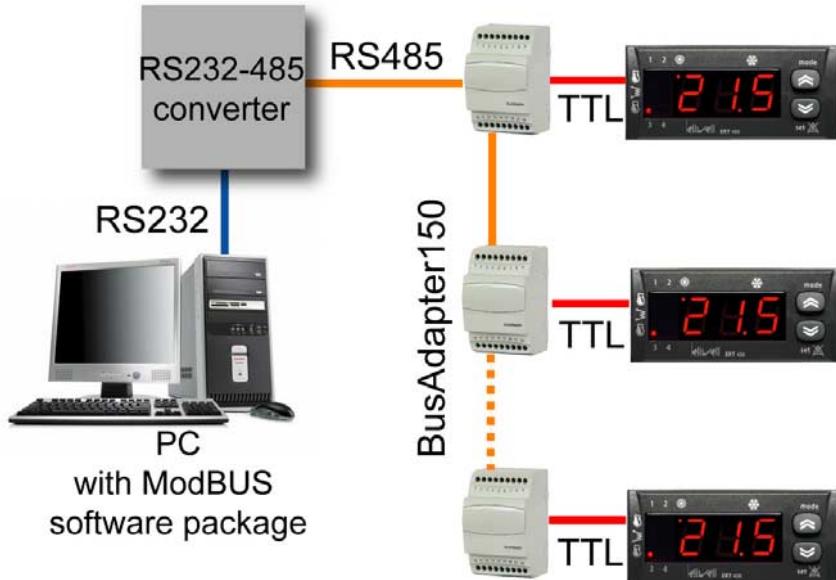

instrument keyboard

copy Card

sending the data using the ModBus protocol, directly to an individual instrument, or by broadcast, using *address* 0 (broadcast)

1.2 Network

ModBus to multiple device connection diagram

PC / Interface connection	RS232 cable
Device / Bus Adapter connection	5-way TTL connector cable (30cm) (other sizes/lengths available)
Bus Adapter	BA150
Bus Adapter / Interface connection	RS485 cable screened and twisted (e.g. Belden cable model 8762)

1.3 Modbus functions available and data areas

See *Parameters table* and *Client table*

Product identification

The product in question can be univocally recognised by means of the hexadecimal Family/Release version values. Regarding the product ECH 400:

Fam/Ver: "502B" formed of Family Code 50Hex = 80 and version 2BHex= 43

IMPORTANT! The reading of 2 registers (WORD) must be requested to obtain 1 in response. If reading of only one register is requested a reading of the highest byte will be obtained.

IMPORTANT! To write values to WORD it is necessary to send a write request with 2 registers, and a dimension 2 response will be obtained.

1.4 Address configuration

The *address* of a device inside a ModBus message is made up of one byte and is formed of the family code and the instrument code, made up of parameters H65 and H66 respectively.

The *address* (Device *Address*) is thus formed of two nibbles:

H66: low nibble

H65: high nibble

To calculate the *address* starting from parameters H65 and H66;

$$\text{address} = \text{H65} \times 16 + \text{H66}$$

For example: *address* (HEX) 16 (H44=01; H45=00)

INSTRUMENT CONFIGURATION PARAMETERS			
Par.	Description	Range	Value
H65	Family serial <i>address</i>	0..14	0
H66	Device serial <i>address</i>	0..14	1
H48	Communication protocol configuration Note: If H48 is changed the controller must be turned off and then on again after they are changed to operate correctly	1=Modbus 0=Televis	1

Address 0 is used for broadcast messages, which are recognised by all slaves. Slaves do not respond to a broadcast type request.

1.5 Address tables

1.5.1 Description of parameters

The *address tables* contain the information required to read, write and decode each individual resource accessible in the instrument.

There are two tables:

- the *parameters table* contains all the device configuration parameters stored in the instrument's non-volatile memory.
- the *client table* includes all the I/O and alarm status resources available in the instrument's volatile memory.

Description of columns:

INDEX For the *parameters table* this value represents the order in which the parameter is displayed in the instrument's menu. For the *client table* this value is not significant.

FOLDER This indicates the *label* of the *folder* containing the parameter in question

LABEL This indicates the *label* used to display the **parameters** in the instrument's menu.

ADDRESS The whole part represents the *address* of the MODBUS register containing the value of the resource to be read or written in the instrument. The value after the point indicates the position of the most significant data bit inside the register; if not indicated it is taken as zero. This information is always provided when the register contains more than one information item, and it is necessary to distinguish which bits actually represent the data (the working size of the data indicated in the column *DATA SIZE* is also taken into consideration). Given that the modbus registers have the size of one WORD (16 bit), the *index* number after the point can vary from 0 (least significant bit -LSb-) to 15 (most significant bit -MSb-). Examples (in binary form the least significant bit is the first on the right):

ADDRESS	Contents of register	DATA SIZE	Value
---------	----------------------	-----------	-------

	8806	1350 (0000010101000110)	WORD	1350		
	8806	1350 (0000010101000110)	Byte	70		
	8806,8	1350 (0000010101000110)	Byte	5		
	8806,14	1350 (0000010101000110)	1 bit	0		
	8806,7	1350 (0000010101000110)	4 bit	10		
Important: when the register contains more than one data item, during the write operation proceed as follows:						
read current register value						
modify the bits that represent the resource concerned						
write the register						
R/W	Indicates the option of reading or writing the resource:					
	R	the resource is read-only				
	W	the resource is write-only				
	RW	the resource can be both read and written				
DATA SIZE	Indicates the size of the data in bits.					
	WORD	=	16 bits			
	Byte	=	8 bits			
	"n" bit	=	0...15 bits based on the value of "n"			
CPL	When the field indicates "Y", the value read by the register requires conversion, because the value represents a number with a sign. In the other cases the value is always positive or null.					
	To carry out conversion, proceed as follows:					
	if the value in the register is between 0 and 32.767, the result is the value itself (zero and positive values)					
	if the value in the register is between 32.768 and 65.535, the result is the value of the register - 65.536 (negative values)					
RANGE	Describes the interval of values that can be assigned to the parameter. It can be correlated with other parameters in the instrument (indicated with the parameter <i>label</i>).					
DEFAULT	Indicates the factory-set value for the standard model of the instrument.					
EXP	This is the multiplier <i>index</i> to be applied for converting the value read from the register to the values indicated in the RANGE and DEFAULT column to convert them into the final values according to the measurement unit indicated in the column M.U.					
	The multiplier is calculated with the base 10 exponential function and with the exponent indicated in the EXP column.					
	When not indicated the value is 0. The following values are valid:					
	Value	Corresponding multiplier				
	-2	=	10^{-2} (0.01)			
	-1	=	10^{-1} (0.1)			
	0	=	10^0 (1)			
	1	=	10^1 (10)			
	2	=	10^2 (100)			
M.U.	Measurement unit for values converted according to the rules indicated in the CPL and EXP columns.

* NOTE: Each parameter can be assigned a “visibility value” as described below:

Value Meaning

- 3 The parameter or *label* is always visible
- 258 The parameter or *label* is visible if the user password is entered correctly (password = Pa H67)
- 770 The parameter or *label* is visible if the user password is entered correctly (password = Pa H67). The parameter cannot be modified.
- 768 The parameter is only visible using a PC
